

## ALUMINIUM MAINTENANCE

This metal, known for its stability, can resist frost, high temperatures and prolonged exposure to the sun.

Easy to clean as follows: dust the surface with a soft cloth, then use cold water and a non-aggressive or abrasive detergent (neutral soap is fine). Do not bleach.

Avoid letting the dirt stains on the surface age, other wise complete removal of the stains is not guaranteed: cleaning immediately means obtaining better results with less effort! To avoid streaks, always remove the detergent, rinse and dry thoroughly. If you are using detergents or solvents that you are unsure of, it is advisable to make a preliminary test in an out of sight corner of the product.
